

Fertilizer Manager (Blending, Billing & Application)

- Creates recommendations, formulas, mix sheets, batches, invoices, field history and maps.
- Invoice as you mix, or in batch for later billing. Apply prepaid and booking contracts in Accounts Receivable. Automatically updates AgVision Inventory records.
- Calculates fees for application, delivery, taxes and miscellaneous services. Prints cost projection statements for customers. Produces a restricted chemical usage report.
- Invoices include field, application, delivery information, and permit numbers.
- Splits bills for up to eight customers with varying percentages for fertilizers, chemicals and applications.
- Handles dry bulk, liquid and suspension formulas; calculates mixes by acres or guaranteed analysis. Figures the precise proportion of water, clay or other suspending agents added to mixes. Add chemicals at the last minute to mix sheets/batches after the material group has been assigned.
- Creates mix-to-grade batches as well as quick blends.
- Quick blend speeds up the billing process for those who want the same blend repeatedly, are performing their own applications, and want to be billed monthly or at the end of the season. Blends are created directly on the mix sheets for the ingredient proportions and then the scale weights are added for additional batches, which will be distributed to the various ingredients proportionately.
- Adjusts ingredients proportionately when actual weights are entered. Gives material density to assist in application settings.
- Creates field history statements for customers. Stores and print field maps downloaded from a variety of sources. Type comments and draw on the maps, color code them and identify hazards for your applicators.
- Designed to run with the AgVision Accounts Receivable, Inventory and General Ledger software.
